These are used for treating cell proliferative disorders including malignant as well as non-malignant cell populations, such as in prostate cancer. The derivative can be linked to a variety of carrier moleties, such as the peptides of the invention. The linkage converts the derivative into an inactive prodrug. AAUSS818-AAUSS861 represent the PSA-specific peptides of the invention

cc immunosuppressive, antirheumatic, antiarthritic, thyromimetic, cc protozoacide, amoebicide, and antibacterial activity. The polynucleotides compy have a use in gene therapy. The recombinant proteins encoded by the cc polynucleotides, or recombinant viruses comprising a Vaccinia virus compositions for treating virus related disease (e.g. cpolynucleotides, or recombinant viruses comprising a Vaccinia virus comparativity papillomatosis, herpes virus infections, liver fibrosis, HIV competities, with mycoblacteria, mycoplasma, amoeba or plasmodia), compilarative disease (e.g. cancer, leukaenia, warts or other skin conditions related to healing of wounds), altergic disease, and/or conditions related to healing of wounds), altergic disease, and/or conditions related to healing of wounds), altergic disease, and/or conditions related to healing of wounds), altergic disease, and/or conditions related to healing of wounds), altergic disease, and/or conditions related to healing of wounds), altergic disease, and/or conditions related to healing of wounds), altergic disease, and/or conditions related to healing of wounds), altergic disease, and/or conditions related to healing of wounds), altergic disease, and/or conditions related to healing of wounds). The protocol of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC length or has at least 70% identity to one of the 316 amino acid
CC sequences. The binding peptide is useful for delivering an agent to a
CC target, which involves conjugating the binding peptide to an agent to
CC form a binding peptide conjugate and exposing a target to the binding
CC peptide conjugate, where the binding peptide conjugate binds to the
CC target. An enzymatic composition comprising the binding peptide is useful
CC involves contacting the surface having tea or wine stain with the
CC enzymatic composition. The surface is preferably a ceramic surface, which
CC enzymatic composition. The surface is preferably a ceramic surface, hair
CC compositions for use in detergent or cleaning compositions such as for
CC compositions for use in detergent or cleaning compositions such as for
CC compositions for a tannin compound is targeted at the early stage of wine
CC crementation process for reducing or eliminating astringency of tannins
CC useful for delivering a bleaching agent to stained teeth for bleaching.
CC The binding peptide and binding conjugate are useful in personal care
CC useful for modifying astringency in skin. This sequence represents a
CC useful for modifying astringency in skin. This sequence represents a
CC use in the stain removal process of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel purified and isolated polynucleotide which comprises a sequence having 137560 by derived from the Parapoxvirus ovis (PPVO) and the open reading frames (ORPs) contained within it. The invention may be useful for the production of compounds with a virucide, cytostatic, antiinflammatory, immunosuppressive or antiallergic activity whilst the disclosed sequences may be useful for gene therapy. The invention is useful for preparing a composition for treating viral or non invential infections, or proliferative, inflammatory, allergic or autoimmune diseases. The present sequence is that of a peptide which represents the N-terminal of a protein encoded by an ORP of the Parapoxvirus genome

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is a possible cleavage site in proSKI-1 which may be targeted by a zymogen to form mature subtilisin kexin isoenzyme 1 (SKI-1). The conserved site was identified by alignment of SKI-1 with other subtilises. SKI-1 is a type-1 membrane-bound proteinase which cleaves probrain-derived neurotrophic factor. Peptides which bind to and are cleaved by SKI-1 may be used for monitoring SKI-1 activity, for screening inhibitors of SKI-1 activity, or for screening enhancers of SKI-1 activity. Proteic fragments of SKI-1 which bind to the SKI-1 catalytic site may be used as inhibitors of SKI-1 activity. They may be used to treat disease involving overexpression of SKI-1 or SKI-1 substrate. Such diseases include hypercholesterolaemia, high levels of fatty acids, lipids or farnesyl pyrophosphate, liver steatosis, Ras-dependent cancer, restenosis and amyloid protein formation
AAR59104-264 are immunogenic 9mer peptides that binding motif. These peptides bind HLA-A2.1 and
                                                                               Example 5; Page 101; 138pp; English.
                                                                                                                                                         Immunogenic peptide(s) having an HLA-A2.1 binding motif - used for treatment or prophylaxis of cancer, virus infection or autoimmune
                                                                                                                                                                                                                                   WPI; 1994-302678/37.

                                                                                                                                                 of at least 1% as compared to a reference peptide (AAR71293). AAR59128 has an IC50 of 0.046 and the sequence occurs at position 1088 in the HBV POL protein. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg. prostate cancer or lymphoma, etc. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DB seq length: 0

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequences of the invention are useful for identifying, diagnosing, monitoring, staging, imaging and treating prostate cancer and non-cancerous disease states in prostate. They are also useful for producing engineered prostate tissue for treatment and research. The PSNA sequences are used in gene therapy and for producing transgenic animals and cells. The invention is also used as vaccines. The present sequence is human prostate specific protein of the invention
            Human tumour-associated antigenic target (TAT) polypeptide #22

New antibody that binds to a tumor-associated antigenic target polypeptide, useful for preparing a composition for diagnosing treating cancer. OT (TAT)

Claim 2; SEQ ID NO 103; 319pp; English.

The present invention relates to the isolation of human tumour-associated antigenic target (TAT) polynucleotide and polypeptide sequences. Also disclosed is an antibody that binds to a TAT polypeptide. The antibody is a monoclonal antibody, an antibody fragment, a chimeric antibody or a humanised antibody. It is conjugated to a growth inhibitory agent. It is produced in bacteria or in CHO cells and induces death of a cell to which it binds. The antibody is useful for preparing a composition for diagnosing or treating tumours and cancer. The present sequence represents a human TAT polypeptide of the invention.

```

The present invention provides the protein and coding sequences of the human T cell receptor alternate reading frame protein (TARP). This protein is expressed in prostate and breast cancer cells at higher levels than normal and so can be used in the immunotherapy of these cancers, as well as their detection and prevention

cancer.

Example 1; Fig 1; 85pp; English

diagnosing and raising

an

P-PSDB; AAB66399, AAB66400.

Isolated T-cell receptor gamma alternate reading frame protein useful for diagnosing and raising an immune response to prostate cancer and breast

immune response to prostate

                                                                                                                                                                                                                                                                                                  assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a patient sample and the normal level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level indicates that the patient is afflicted with prostate cancer. Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in ADB75177-ADB75631 represent marker cDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed CDNA identices. Such ESTs are not well suited for isolating CDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This protein is expressed in prostate and breast cancer cells at higher levels than normal and so can be used in the immunotherapy of these cancers, as well as their detection and prevention

                                                                                                                                                  The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a patient sample and the normal level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level indicates that the patient is afflicted with prostate cancer. Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in ADB7517-ADB75631 represent marker cDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

cc described: (1) a vector comprising (1); (2) a host cell comprising the cector of (1); (3) a process for producing a PRO polypeptides; (4) an isolated PRO polypeptide; (5) a chimeric molecule comprising the composition of (4) fused to a heterologous amino acid sequence; (6) an cc polypeptide of (4) fused to a heterologous amino acid sequence; (6) an cc antibody which specifically binds to a polypeptide of (4); (7) a cc composition of matter comprising a polypeptide of (4), an agonist or comprising a container, a label on the container and a composition of manufacture polypeptide in combination with a carrier; (8) an article of manufacture comprising a container, a label on the container and a composition of cc matter of (7); (9) a method of treating an immune related disease in a cc mammal; (10) a method of treating an immune related disease in a sample suspected of having the polypeptide; (11) a method of container and a compound that inhibits or cc mainish and (13) a method of identifying a compound that inhibits or cc antiatematic, antiality of or expression of a gene encoding a PRO polypeptide container and a compound that inhibits or cc antiasthmatic, antithyroid, CNS, dermatcological, gastrointestinal, cc antiarcopic, insuroprotective, osteopathic, antiaritritic, cc antiarcopic, neuroprotective, osteopathic, respiratory, vasotropic and cc useful in diagnosing and treating an immune related disease and in stimulating an immune response. The present sequence represents a human cc protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immune response stimulation; antiallergic; antianaemic; antiarthritic; antiasthmatic; antidiabetic; antiinflammatory; antipsoriatic; antirheumatic; antithyroid; CNS; dermatological; gastrointestinal; haemostatic; hepatotropic; immunostimulant; immunosuppressive; muscular; nephrotropic; neuroprotective; osteopathic; respiratory; vasotropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New PRO polynucleotides and polypeptides, useful in useful in diagnosing and treating an immune related disease, e.g. systemic lupus erythematosus, rheumatoid arthritis, diabetes mellitus or asthma and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          18-NOV-2004 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1; SEQ ID NO 839; 3009pp; English
